

NSW AND VICTORIAN INJECTING ROOMS

. . . definitively enriching the drug trade, failure to meet objectives

1. 99% of Australians do not approve heroin use, thereby indicating they would not approve any government interventions aiding and abetting increased opiate use
2. Staggering numbers of overdoses in Australia's injecting rooms are caused by users experimenting with drug cocktails or increased opiate doses. This inevitably entails purchasing more drugs which must inevitably enrich local drug dealers
3. Research data indicates injecting rooms do not improve local amenity
4. Research data indicates injecting rooms do not reduce blood-borne virus transmissions
5. Injecting rooms uniformly have very poor referral outcomes
6. Injecting rooms have demonstrated a clear honey-pot effect, attracting dealers to the streets outside the facility, prompting expensive preventative policing operations
7. Policing operations have been mostly responsible for reductions in ambulance callouts for overdose in local areas, not injecting rooms
8. For the cost of saving 1 life in an injecting room, many users can enter rehab, saving lives

**Central Issues
&
Compiled Evidence**

DRUG FREE AUSTRALIA

The failure of NSW and Victorian injecting rooms

According to the last 2016 National Drug Strategy Household Survey of 25,000 Australians, **99% do not approve of regular heroin use.**¹

While 55% of Australians surveyed support injecting rooms as an intervention² there has been a program of constant misinformation about injecting rooms by supporters fed to a gullible or complicit Australian media. If the same media reported the reality that injecting rooms are demonstrable accessories to the drug trade, condemnation would unquestionably be as high as the 99% disapproval rate of heroin use

North Richmond MSIR	Kings Cross MSIC
<p>Overdose rates</p> <p>Overdose (OD) rate - 23.5 per 1,000 injections³ Street OD rate - 0.2/1,000 injections (MSIC)⁴ MSIR OD rate – 102 times higher than normal street OD rates⁵</p> <p>Testimony by ex-clients of the MSIC in rehab⁶ is that the overdose rates are so extraordinarily high because clients experiment with higher doses of drugs in the facility⁷</p> <p>Experimentation with higher doses inevitably means that more drugs are purchased from local dealers to service the inordinate overdose rates, lining drug dealers' pockets. This conclusion is inescapable and is damning for injecting rooms</p> <p>This makes the MSIR a government-funded accessory to the North Richmond drug trade, where extra drugs purchased created OD rates 102 times higher than normal</p>	<p>Overdose rates</p> <p>Highest OD rate – 14.6/1,000 injections (2010)⁸ Pre-MSIC street rate – 0.2/1,000 injections⁹ MSIC OD rate – up to 63 times higher than clients' pre-MSIC rate of OD¹⁰</p> <p>Testimony by ex-clients of the MSIC in rehab is that the overdose rates are so extraordinarily high because clients experiment with higher doses of drugs in the facility</p> <p>Experimentation with higher doses inevitably means that more drugs are purchased from local dealers to service the inordinate overdose rates, lining drug dealers' pockets. This conclusion is inescapable and is damning for injecting rooms</p> <p>This makes the MSIC a government-funded accessory to the Kings Cross drug trade, where extra drugs purchased created OD rates 63 times higher than normal</p>
<p>Public Amenity – MSIR Objectives (d) and (e)</p> <p>The MSIR failed to improve public amenity with local residents reporting no reductions in discarded needles, and local businesses reporting <i>increases</i>¹¹</p> <p>Public injection was reported by less residents and businesses after the MSIR opened¹², but <i>increases</i> in discarded needles inevitably entails more public injections. Policing crackdowns, which appear to have moreso been during hours the MSIR was open, would likely have moved</p>	<p>Public Amenity – MSIC Objective 3</p> <p>The heroin drought, which started 6 months before the MSIC opened¹³, drastically reduced discarded needles across the entirety of Australia. The MSIC's 4th Evaluation¹⁴ failed to demonstrate any reductions beyond those caused by the drought. The 2010 KPMG Evaluation¹⁵ made no attempt to get relevant data and failed to mention changed policing¹⁶ since 2001 which would undoubtedly affect needle counts</p> <p>Reports by residents (1st Evaluation and KPMG</p>

<p>public injection to night-time when less people were around to see it</p>	<p>Evaluation) of seeing less public injecting were unquestionably the result of the heroin drought and no account was taken by KPMG of changed policing since 2001</p>
<p>Reductions in Blood-Borne Virus Transmissions – MSIR Objective (f)</p> <p>Failure to demonstrate that MSIR clients were less likely than other users to report using other's used injecting equipment¹⁷</p>	<p>Reductions in Blood-Borne Virus Transmissions – MSIC Objective 4</p> <p>Failure to demonstrate in any one of its many Evaluations any objective reductions in injection-related BBV transmissions¹⁸</p>
<p>Providing a gateway to drug treatment – MSIR Objective (b)</p> <p>Failure to demonstrate any higher uptake of treatment services than other non-MSIR drug users</p> <p>While 22%¹⁹ of MSIR clients at intake expressed a desire for referral to treatment, only 8% were in fact referred²⁰</p>	<p>Providing a gateway to drug treatment – MSIC Objective 2</p> <p>Abnormally low levels of referral to treatment at only 11% of clients referred.²¹ A Scottish study of methadone users found 57%²² wanted to get clean, which would be similar to Australian heroin users. By comparison 22% of Victorian MSIR clients at intake expressed a desire for referral to treatment²³</p>
<p>Extensive policing to reduce honey-pot effect</p> <p>Adding to the failure against objectives listed above, police complained of surging crime²⁴ around the MSIR, and residents of a honey-pot effect²⁵ where drug dealers were drawn to the streets directly outside the MSIR</p> <p>The very high costs of the extensive policing added around these facilities around the time of their implementation is a best-kept secret concealed by injecting room evaluators/ reviewers from the media. Cost evaluations of injecting rooms worldwide <i>never</i> add these real and very high costs of policing to the costs of running these facilities</p>	<p>Extensive policing to reduce honey-pot effect</p> <p>The 1st MSIC Evaluation had ample data demonstrating a visible honey-pot effect²⁶ where dealers were drawn to the doors of the MSIC. Not one of the many MSIC Evaluations even mentioned the ongoing implementation of sniffer dog policing one month after the MSIC opened which aimed to move drug dealers out of the Kings Cross postcode</p> <p>The very high costs of the extensive policing added around these facilities around the time of their implementation is a best-kept secret concealed by injecting room evaluators/ reviewers. Cost evaluations of injecting rooms worldwide <i>never</i> include these real and very high costs of policing to the costs of running these facilities</p>
<p>Policing operations reduced ambulance callouts – MSIR Objective (c)</p> <p>Failed to reduce ambulance callouts. On any of the streets of Melbourne, the MSIR's 112,831²⁷ opiate injections in its first 18 months would have caused just 26 overdoses, (25 non-fatal and 1 fatal) according to the MSIC's 1st Evaluation.²⁸ 19, at most, would likely be attended by an ambulance²⁹</p>	<p>Policing operations reduced ambulance callouts</p> <p>With less than 50,000 opiate injections per year³⁴ the MSIC would at best reduce overdoses in the Kings Cross community by 11 ambulance callouts per year³⁵</p> <p>The MSIC's 2007 4th Evaluation claimed 80% reductions in ambulance callouts in Kings Cross against reductions of 61% throughout NSW as</p>

Overdoses in the MSIR, which should have numbered no more than 26 anywhere else outside an injecting room, would reduce ambulance callouts in North Richmond by just 5%.³⁰ However the MSIR Review records the facility calling 30 ambulances to take their clients to hospital in 18 months³¹, which means **it increased, not decreased, ambulance callouts**

The review egregiously claimed callout reductions of 36%,³² which were clearly due to heightened police operations³³ around the MSIR

caused by the national heroin drought.³⁶ This was a reduction 31% better than the rest of NSW during the hours the MSIC was open. During the hours it was closed there was a 69% better reduction in callouts,³⁷ demonstrating that the **sniffer dog policing** of Kings Cross, introduced within a month of the MSIC opening,³⁸ **was likely responsible**. NSW Parliament Hansard records that sniffer dog policing was active not only during the day, but highly active at night³⁹ into the hours shortly before dawn⁴⁰

**Save lives from fatal overdose
 – MSIR Objective (a)**

On any of the streets of Australia, one heroin user will die for every 109,500 opiate injections.⁴¹ The MSIR recorded around 75,000 opiate injections per year in its first 18 months of operation, **clearly not enough to save even one life in 18 months**⁴²

For the \$6 million⁴³ spent by the MSIR to save one single life, the Victorian government could provide 73 optimally-funded residential rehab beds for a full year.⁴⁴ **The same funding can save one life (which can nevertheless be lost tomorrow injecting elsewhere) or make many users drug-free.** The MSIR is multiplying policing expenditures with growing crime, while failing to stop overdoses by clients for the 58 in every of their 60 opiate injections they average OUTSIDE the MSIR.⁴⁵ Successfully rehabilitated users reduce the need for police expenditures and ambulance interventions as drug use is ceased altogether. Closure of the MSIR will immediately stop the mass experimentation with drugs currently happening, an experimentation which is likely to only promote more opiate-related deaths outside the facility.

**Save lives from fatal overdose
 – MSIC Objective 1**

On any of the streets of Australia, one heroin user will die for every 109,500 opiate injections. The MSIC averaged around 51,000 opiate injections annually over its first 9 years of operation⁴⁶, **clearly not enough to save even one life in two years of operation**

For the \$6 million spent by the MSIC to save one single life,⁴⁷ the NSW government could provide 73 optimally-funded residential rehab beds for a full year. **The same funding can save one life (which can nevertheless be lost tomorrow injecting elsewhere) or make many users drug-free.** The MSIC multiplies policing expenditures to stifle drug-related crime in Kings Cross, while failing to stop overdoses by clients for the 95% of injections they average OUTSIDE the MSIC. Successfully rehabilitated users reduce the need for police expenditures and ambulance interventions as drug use is ceased altogether. Closure of the MSIR will immediately stop the mass experimentation with drugs currently happening, an experimentation which is likely to only promote more opiate-related deaths outside the facility.

(a) Support or strongly support (calculations based on those respondents who were informed enough to indicate their level of support).

Note: Question was modified in 2013. Measures taken to address problems associated with heroin use, was removed and measures taken to address problems associated with injecting drug use was reworded and new responses were added. Therefore comparisons to previous waves should not be made.

Source: NDSHS 2016

³ The MSIR [review](#) records that the facility had a total [116,802 supervised injections](#) (p x) in its first 18 months, of which [96.6%](#) (p x) were heroin injections which are subject to fatal overdose. This gives 112,831 heroin injections against 2,657 (p x) overdoses or 23.5/1,000 injections

⁴ Clients of the Kings Cross MSIC were considered by the 2003 [1st MSIC Evaluation](#) to be at higher risk of overdose than normal (p 62) and so the previous overdose rates of MSIC clients, as recorded when registering to use the facility, can well be used as normative for the MSIR. 44% (see p 8) of MSIC clients had overdosed before registering, with a heroin-use career spanning an average 12 years (see p 8) and a median average of three overdose episodes in the 12 years (see page 16). From this data, their average rate of overdose can be calculated. Using the MSIC Evaluation's own assumption of 'at least' three injections per day per dependent heroin user (see p 58), and keeping in mind that, for example, [8 injections per day](#) for heroin users is not extraordinary, we can calculate the number of injections per user per year (3 x 365 = 1,095 injections per year), then calculate one non-fatal overdose every 4 years giving a rate of 1/4,380 injections (4 x 1,095 injections) or 0.23/1,000. The real rate would be quite a deal lower given that 3 injections per day is a low estimate, and this is the rate for only 44% high risk clients in the MSIC, where the other 56% have no overdoses but many injections

⁵ Their staggering overdose rate of 23.5/1,000 injections can be divided by the normative rate of overdose (see footnote 4) of 0.23/1,000 giving the result of 102 times higher than normal

[file:///C:/Users/gxian/Documents/Drugs/Interventions/Injecting%20Room/ADRAAnalysis/Lobbying/Full%20Day%20Hansard%20Transcript%20\(Legislative%20Council,%2026%20June%202007,%20Proof\)%20-%20NSW%20Parliament.htm](file:///C:/Users/gxian/Documents/Drugs/Interventions/Injecting%20Room/ADRAAnalysis/Lobbying/Full%20Day%20Hansard%20Transcript%20(Legislative%20Council,%2026%20June%202007,%20Proof)%20-%20NSW%20Parliament.htm) and by NSW Andrew Fraser MP

[https://web.archive.org/web/20121102211713/https://www.parliament.nsw.gov.au/Prod/parliament/hanstrans.nsf/V3ByKey/LA20101021/\\$File/541LA217.pdf](https://web.archive.org/web/20121102211713/https://www.parliament.nsw.gov.au/Prod/parliament/hanstrans.nsf/V3ByKey/LA20101021/$File/541LA217.pdf) recording the observations of MSIC ex-clients on why the overdose rate is so imaginably high.

⁷ The [1st MSIC Evaluation](#) (see p 62) noted that "In this study of the Sydney MSIC there were 9.2 heroin overdoses per 1000 heroin injections in the MSIC, and this rate of overdose is likely to be higher than among heroin injectors generally. The MSIC clients seem to have been a high-risk group with a higher rate of heroin injections than heroin injectors who did not use the MSIC, they were often injecting on the streets, and they may have taken more risks and used more heroin in the MSIC." The evaluators never bothered to measure this inordinately high rate of overdose against MSIC clients' own histories of overdose or rates of overdose derived therefrom. The rates were high because of unchecked MSIC client experimentation with more drugs and drug cocktails – see speech by NSW Upper House MLC Gordon Moyes

[file:///C:/Users/gxian/Documents/Drugs/Interventions/Injecting%20Room/ADRAAnalysis/Lobbying/Full%20Day%20Hansard%20Transcript%20\(Legislative%20Council,%2026%20June%202007,%20Proof\)%20-%20NSW%20Parliament.htm](file:///C:/Users/gxian/Documents/Drugs/Interventions/Injecting%20Room/ADRAAnalysis/Lobbying/Full%20Day%20Hansard%20Transcript%20(Legislative%20Council,%2026%20June%202007,%20Proof)%20-%20NSW%20Parliament.htm) and by Andrew Fraser MP

[https://web.archive.org/web/20121102211713/https://www.parliament.nsw.gov.au/Prod/parliament/hanstrans.nsf/V3ByKey/LA20101021/\\$File/541LA217.pdf](https://web.archive.org/web/20121102211713/https://www.parliament.nsw.gov.au/Prod/parliament/hanstrans.nsf/V3ByKey/LA20101021/$File/541LA217.pdf)

⁸ See 2010 MSIC Evaluation by [KPMG](#) (p 154) for the overdose rates per year up to 2010

⁹ See endnote 4 above

¹⁰ The MSIC overdose rate of 14.6/1,000 injections can be divided by the normative rate of overdose (see footnote 4 of 0.23/1,000 giving the result of 63 times higher than normal.

¹¹ p 76 of the MSIR [review](#) states that “Local people record no difference in seeing discarded injecting equipment” Also, “There was an increase in the median number of discarded syringes seen by business respondents during the trial (six to 10 per month)” (p 76)

¹² DFA notes that [the review’s](#) cited (small) reductions in reported sightings of public injecting ([p xx](#)) are clearly countered by increases in publicly discarded injecting equipment ([p xx](#)) which inevitably indicates INCREASED public injecting. Policing crackdowns during [daytime](#) obviously increased night-time injecting, when public injecting is less likely to be observed by local residents or businesses. This increase in public injecting is witnessed by the increases in ambulance callouts at night (p 71)

¹³ The heroin drought commenced December 2000

https://www.researchgate.net/publication/237404353_The_Australian_Heroin_Drought_and_its_Implications_for_Drug_Policy and the MSIC opened May 6, 2001. Australia has never recovered from the heroin drought

¹⁴ <https://kirby.unsw.edu.au/report/sydney-medically-supervised-injecting-centre-msic-evaluation-report-4> see page 32ff

¹⁵ <https://www.health.nsw.gov.au/aod/resources/Documents/msic-kpmg.pdf> see p xi

¹⁶ Sniffer dog policing commenced 1 month after the MSIC opened (see speech by Clover Moore

<https://www.parliament.nsw.gov.au/Hansard/Pages/HansardResult.aspx#docid/HANSARD-1323879322-25542/link/11>) in the Kings Cross postcode and very successfully <https://www.zdnet.com/article/sniffer-dog-avoidance-a-wireless-app-with-bite/> moved dealers out of the postcode into neighbouring postcodes, particularly next-door Darlinghurst

¹⁷ MSIR [review](#) (p 100) states that “There is not a significant difference between MSIR service users and other people who inject drugs in reporting that they had injected with someone’s used needle/syringe in the previous month.”

¹⁸ 2010 MSIC Evaluation by [KPMG](#) (p 4) records that “. . . it is not possible however to attribute any change in infection notifications to the operation of the MSIC” –DFA notes that the KPMG Evaluation, in assessing evidence regarding blood-borne virus transmissions, made no mention of the obvious heroin drought which was responsible for less needles being distributed by pharmacies and needle & syringe programs, and which remained active in 2010 and beyond. Nor did they make any mention of sniffer dog policing driving dealers, drug purchases and their associated overdoses to other areas of Sydney

²⁶ 2003 [1st MSIC Evaluation](#) p 146ff

²⁷ See endnote 3

²⁸ The 2003 [1st MSIC Evaluation](#) (p58) cited the Darke et al. study which found that there 1 fatal overdose in every 24 overdoses, the remainder being non-fatal overdoses. On this data we can calculate the number of injections per overdose, given that there is solid Australian [data](#) indicating that [one in every 100](#) dependent heroin users die each year from a fatal opiate overdose. If dependent heroin users are injecting ‘at least’ 3 times a day, as calculated by the 1st MSIC Evaluation (p58), there is one death for every 109,500 injections (3 injections per user per day x 365 days in a year x 100 users for which one injection will be fatal). There will be 24 overdoses per 109,500 injections, giving a rate of 1/4,563 injections, very similar to the previous overdose rates recorded by MSIC clients when registering to use the MSIC. Using the MSIC clients previous overdose rate of 1/3,480 injections we find that the 112,831 opiate injections in the MSIR SHOULD have only caused 26 overdoses, of which one would be fatal

²⁹ Again we are being extremely generous – the Darke et al. study mentioned in endnote 28 found that an ambulance attended only 51% of their examined overdoses. We have more generously calculated according to the registration data of Kings Cross MSIC clients which had 74% of previous overdoses attended by an ambulance. Thus 19 of the 26 expected overdoses from 112,831 injections in the MSIR would have likely caused an ambulance callout. If we had calculated on Darke et al.’s 51% it would have been just 13 callouts that would be foregone by the presence of the MSIR

³⁰ In the 18 months before the MSIR there were 382 ambulance callouts within a 1 km radius. If the (generous) 19 callouts are deducted, we would normally have expected the MSIR to reduce that number to 363 (388 minus 19 callouts), which is a 5% reduction

³¹ MSIR [review](#) p xi

³² MSIR [review](#) p 69

³³ <https://www.heraldsun.com.au/news/victoria/police-target-drug-traffickers-and-crime-in-richmond-during-operation-apollo/news-story/c7b10e05340619b9282588ca81889bd9>

³⁴ The KPMG Evaluation recorded 604,022 injections (p ix) in 9 years, of which a maximum 76.5% (p 107) were opiate injections, averaging 51,275 opiate injections per year

³⁵ With the 446,976 opiate injections over 9 years (see previous endnote) expected to produce an overdose for every 4,380 injections, (see endnote 4) the number of expected overdoses would be 102, or 11 per year over 9 years.

³⁶ See the 2007 [4th MSIC Evaluation](#) p 24ff

³⁷ In the Salmon et al. 2010 [study](#) on ambulance callouts, which replicated data from MSIC [Evaluation 4](#) compare data on daytime callouts versus callouts outside MSIC operating hours (p 680)

³⁸ NSW Parliament Hansard, "Police Sniffer Dogs" 23 October 2001

<https://www.parliament.nsw.gov.au/Hansard/Pages/HansardResult.aspx#docid/HANSARD-1323879322-25542/link/11>

³⁹ <http://www.mapinc.org/drugnews/v01/n1987/a09.html?4817>

⁴⁰ See speech by Mrs A Megarrity <https://www.parliament.nsw.gov.au/Hansard/Pages/HansardResult.aspx#docid/HANSARD-1323879322-25542/link/11>

⁴¹ See endnote 4

⁴² The MSIR review recorded 112,831 heroin injections during the first 18 months (see endnote 3), averaging 75,221 injections for the first 12 months (it was actually less than that due to a slow startup for the MSIR). The MSIR needed 109,500 injections to claim one life saved, and 75,000 injections does not even come close

⁴³ https://www.parliament.vic.gov.au/images/stories/committees/irrcsc/Drugs_Final_-_Victorian_Government_Response_to_the_Parliamentary_Inquiry_into_Drug_Law_Reform_X1wNyVpZ.pdf records funding

of \$4 million per year which gives \$6 million in 18 months

⁴⁴ In August 2018 the NSW Legislative Council's Portfolio Committee No.2 (Health and Community Services) Report 49 recommended "That the NSW Government significantly increase funding to drug and alcohol related health services" (Recommendation 2). The NADA submission

https://www.nada.org.au/wp-content/uploads/2019/03/NADA-Submission_-_NSW-AOD-Beds_120319.pdf recommended \$224.95 of funding per bed day for residential rehabs, which equals \$82,106 per annum or 73 bed years for the \$6 million to save one life in an injecting room. If patients are offered 6 months of rehab each over 140 users will have been assisted towards being drug-free, freeing them from the morbidity of non-fatal overdoses and freeing the community of crime and public nuisance

⁴⁵ The MSIR review (p ix) indicates MSIR clients average 14 opiate injections per week which is 728 per year, or 60 per month on average. There were 112,831 heroin injections in 18 months recorded by the MSIR by the 3,936 clients, giving an average of 29 injections per client in 18 months or 19 per year, averaging a little over 1.5 injections per month. 58 of clients' average 60 injections per month were not in the MSIR.

⁴⁶ The 2010 [KPMG](#) Evaluation recorded a total of 604,022 injections (p ix) in the 9 years evaluated, of which 76.5% were opiate injections (p 108). This gives 461,473 opiate injections, averaging 51,275 opiate injections annually.

⁴⁷ In 2007 the MSIC cost \$2.7 million to operate according to the 2007 [4th Evaluation](#) (p35). With current operating costs unable to be identified from MSIC records or State budgets, \$3 million per year in 2020 is a very conservative estimate
